periodic differential equations appear in many contexts such as in the theory of nonlinear oscillators in celestial mechanics or in population dynamics with seasonal effects the most traditional approach to study these equations is based on the introduction of small parameters but the search of nonlocal results leads to the application of several topological tools examples are fixed point theorems degree theory or bifurcation theory these well known methods are valid for equations of arbitrary dimension and they are mainly employed to prove the existence of periodic solutions following the approach initiated by massera this book presents some more delicate techniques whose validity is restricted to two dimensions these typically produce additional dynamical information such as the instability of periodic solutions the convergence of all solutions to periodic solutions or connections between the number of harmonic and subharmonic solutions the qualitative study of periodic planar equations leads naturally to a class of discrete dynamical systems generated by homeomorphisms or embeddings of the plane to study these maps brouwer introduced the notion of a translation arc somehow mimicking the notion of an orbit in continuous dynamical systems the study of the properties of these translation arcs is full of intuition and often leads to non rigorous proofs in the book complete proofs following ideas developed by brown are presented and the final conclusion is the arc translation lemma a counterpart of the poincaré bendixson theorem for discrete dynamical systems applications to differential equations and discussions on the topology of the plane are the two themes that alternate throughout the five chapters of the book

strongly coupled or cross diffusion systems of parabolic and elliptic partial differential equations appear in many physical applications this book presents a new approach to the solvability of general strongly coupled systems a much more difficult problem in contrast to the scalar case by unifying elucidating and extending breakthrough results obtained by the author and providing solutions to many open fundamental questions in the theory several examples in mathematical biology and ecology are also included contents interpolation gagliardo nirenberg inequalities the parabolic systems the elliptic systems cross diffusion systems of porous media type nontrivial steady state solutions the duality rbmo h1 some algebraic inequalities partial regularity
